

# Todo List

## 1. high

- **[build]** Autoconfuse # ST
- **[code]** More solid hostname registration code. This may be taken care of by newer version of Howl. # ST

## 2. medium

- **[code]** Add support for zmdns. Do this after autoconfuscation, so that we can enable the proper backend at build time. # ST
- **[code]** Learn about https protocol so we can register SSL-enabled servers # ST

## 3. low

- **[code]** IPv6 compatibility; Apache can do it, the Zeroconf standard is designed to handle it but it doesn't look like Howl can do it. # ST
- **[build]** Build against alternative mDNS implementations as they emerge: this would be a requirement for a MacOSX port. # ST
- **[code]** Learn about DAV, ... # ST
- **[code]** Port to MacOSX? Apache 1.3? # ST
